

ABSTRACT OF THE DISCLOSURE

The invention provides a driver's cab for a work vehicle which is provided with a function of effectively transferring an external force applied to a ceiling portion to a pillar without making a structure complex, and can achieve a reinforced structure. In a driver's cab (1) in a working vehicle, the driver's cab being structured by a pipe-like member, a connection member (30 (31)) for dispersing a stress is arranged in a support pillar (11 (12)) in an opposite side particularly in the case that an external force is applied to a transverse outer side of a ceiling portion.
